

Cactus API

For Customization, Integration, and Automation

The Cactus API (Application Program Interface) provides flexibility for easy integration with Cactus applications and platforms you are already using. Connect all of your business-critical applications back to our Central Provider Information Repository, so you can achieve a 360-degree view of your provider network.

APIs allow software developers to write applications that communicate with other systems and services. APIs may expose data or metrics from the system or service, as well as configuration options and system status.

Why use the Cactus platform?

The Cactus platform is built on top of industry-standard open source components that reduce the costs of licensing and maintenance. This also enables rapid application development, flexible data integration and technology adaptation to help future-proof your healthcare solutions in this rapidly changing technology environment.

Features and benefits

With Cactus open APIs, you can access metrics and configuration controls of the Cactus platform infrastructure. This allows you to customize how you consume metrics and automate configuration, including:

- Exporting indexed packets from Cactus for custom analysis
- Improved data acquisition and logging capabilities for collecting and analyzing data
- Our open APIs allow you to extend the value of your Cactus infrastructure with customization, integration, and automation.
- With APIs, you can write software that automates processes. This saves time and effort, while producing more consistent results.
- Cactus add-ons are built on top of the Cactus API, and as a result, the API remains accessible up to the level of the custom add-ons, and the integration of existing and newly developed functionality becomes effortless.
- Cactus uses REST-ful APIs that are easy to use for both clients and servers.
